

Ideation Phase: Brainstorm & Idea Prioritization

Project: Implement Client Script and UI Policy for Incident | Date: 30 September 2026 | Team ID: SWTID-2026-8886

Step 1 - Select the problem statement

Service desk agents need a consistent way to triage high-impact Incidents. Manual entry can leave urgency or ownership incomplete, and a direct list edit can bypass the guided form.

Working hypothesis: require Assignment group and Assigned to, set Urgency to High when Impact changes to High, validate routing before save, and redirect State changes to the record form.

Step 2 - Brainstorm and group ideas

Incident Control Ideas

Select high-value, low-effort changes first

IDEA 1

Require Assignment group on High impact

IDEA 2

Require Assigned to on High impact

IDEA 3

Set Urgency to High when Impact changes

IDEA 4

Explain missing fields before save

IDEA 5

Decline State list edits

IDEA 6

Add server-side enforcement if mandatory

Idea board: client-side controls first; server-side enforcement is a future requirement where bypass paths matter.

Step 3 - Prioritize ideas

Initial team estimate; validate effort and value with project stakeholders.

Value versus effort is a planning hypothesis, not measured delivery data.

Idea	Value	Effort	Disposition
UI Policy: require group and assignee; make Urgency read-only	High	Low	Implement first
Impact onChange: set Urgency to 1 (High)	High	Low	Implement first
onSubmit: explain missing routing and stop save	High	Low	Implement first
onCellEdit: decline list State edit	Medium	Low	Demonstrate; not security
Server-side validation for non-UI entry	High if policy requires	Medium	Future extension
