

ServiceNow Incident Management

Project Documentation Format

1. Introduction

Project title: Implement Client Script and UI Policy for Incident.

Team members: To be completed by team. Suggested roles are project lead, ServiceNow configurator, and tester.

2. Project Overview

Purpose: improve Incident data quality for high-impact triage. Features: required routing, automatic urgency, save validation, and list-edit workflow guidance.

3. Architecture

User interface: ServiceNow desktop Incident form and list. A UI Policy and three Client Scripts provide client-side behavior.

Platform and data: ServiceNow handles the Incident table and existing authorization and server rules. No separate backend, database, external API, or model is added.

4. Setup Instructions

Prerequisites: a non-production ServiceNow instance and configuration access. Create High Impact Control, add its three actions, then configure the onChange, onSubmit, and onCellEdit scripts.

5. Project Files

The phase folders contain completed templates. The Development Phase includes Client Scripts, a UI Policy configuration note, UAT cases, and diagrams.

Source files are script bodies for manual configuration, not an importable update set. Do not store instance credentials in the project files.

6. Running the Application

There is no standalone application. Open an Incident in a non-production instance and perform the documented UAT scenarios.

Do not run a local front end or backend; the behavior runs within the ServiceNow interface.

7. API Documentation

No custom APIs or integrations are used. The scripts use the platform form API in the supported UI.

8. Authentication and Authorization

No authentication system is added. Existing ServiceNow login, roles, ACLs, Data Policies, and Business Rules remain in control.

9. User Interface

The included wireframe is conceptual and illustrates the intended high-impact form state; it is not a screenshot from a live instance.

10. Testing

Eight functional UAT cases are prepared. Actual results are Not run because no ServiceNow instance was supplied. Performance measurements are pending.

11. Screenshots and Demo

Only conceptual diagrams are included. Add approved instance screenshots after the team deploys and tests the configuration.

12. Known Issues

Verify field names and choice values locally. Client controls do not enforce rules through APIs or other server paths. State list blocking may conflict with local workflows.

13. Future Enhancements

Add suitable server-side validation if required, package the configuration as an approved update set, test Workspace support, and review pilot data quality.

Appendix Source Code

See the three JavaScript files in the Development Phase Client Scripts folder. The policy settings are in High_Impact_Control_UI_Policy.txt.

ServiceNow Incident Solution Architecture
Standard platform components - no external APIs or ML model

The project changes the client experience; it does not replace server-side security.

Incident client-control architecture

Incident High Impact Data Flow
Form inputs move through client controls to the Incident table

Client controls support data quality; enforcement for non-form paths must be server-side.

Conceptual form illustration - not a live screenshot

Script type	Purpose
onChange on Impact	Set Urgency to High when Impact changes to High.
onSubmit	Block a high-impact save if Assignment group or Assigned to is empty.
onCellEdit on State	Decline direct list edits and prompt the user to open the record.

Project note: values use the standard Incident choices where Impact 1 and Urgency 1 represent High. Confirm field names and values in the target instance.
